measurements, average power is the most frequently measured because convenient measurement equipment with highly accurate and traceable specifications is available. Additional waveform information can sometimes be calculated from average power measurements if certain waveform characteristics are known. If, for example, the duty

## **RF Power Measurement Basics - Keysight**

Among the types of RF power measurements, the steady state RF power of a CW tone is perhaps the simplest. Peak power, such as the overshoot of an RF pulse or IQ waveform, is the maximum value over some period of time. The power measurement can be averaged across a time period, such as across a series of RF pulses, yielding the average power.

Radio frequency (RF) energy, in the form of radiating waves or electrical currents, has been used in medical treatments for over 75 years, generally for minimally invasive surgeries using radiofrequency ablation including the treatment of sleep apnea. Sure, it may not be tuned for a particular carrier frequency, meaning that the voltage levels that you measure on the oscilloscope may not be an accurate representation of the actual RF field strength. But you can still “sniff” signals out of the air to verify proper modulation and timing of your RF-modulated signals. Figure 4.

The average power measurement using the power sensor reports a power of -27.01dBm. The measurement using the analyser power meter reports an average power of -26.8dBm. For the analyser measurement, the span was set to 3MHz to capture most of the waveform's sideband energy. Increasing the span to more than 3MHz did not change the measured power.

- A quarter wave antenna is an easy and good solution, but it is not small (433 MHz: 16.4 cm, 868 MHz: 8.2 cm) You can “curl up” such an antenna and make a helical antenna. This is often a good solution since it utilizes unused volume for a product. ...

The I/Q modulator mixes the I waveform with the RF carrier sine wave, and it mixes the Q signal with the same RF carrier sine wave at a 90-degree phase offset. The Q signal is subtracted from the I signal (just as in the equation shown in line 3 in Figure 10) producing the final RF modulated waveform.

Averaging 512 cycles yields a clear and relatively stable waveform. That happens because noise, consisting of random, non-periodic fluctuations, cancels out and is eliminated in the display when a sufficient number of waveforms are averaged. Radio frequency interference (RFI) is an entirely different source of noise.
